

1. Hinges

The unique square design of the S&E hinges, positioned out of the eye line at the very top and bottom of the door, not only produces the most transparent look for a frameless enclosure on the market today but also supports the glass, making us the only manufacturer able to "guarantee for life" our doors not to drop under their own weight.

A patent design rise and fall action occurs when opening and closing the door to prolong the life of the seals whilst providing an unlimited adjustable stop position. Machined from solid brass and chrome plated, you could say we are unmatched for both style and quality.

Features and Benefits of S&E Glass Design

2. Glass Tailoring

Glass tailoring is a method pioneered by S&E Glass Design over the years to guarantee minimal silicone lines. Particularly suited to rooms in old buildings that have walls out of level and kicking. Our exclusive method of course also complements straight walls, as it always highlights the beauty of an uninterrupted tile pattern running behind the glass, which adds to the illusion of more space in the bathroom.

3. Support Bars

Support bars by S&E Glass Design are individually produced to a clients exacting dimensions and requirements. They are crafted using high quality stainless steel and various connecting parts made from brass and chrome plated. The result is a continuous and minimal 15 mm diameter support. The fixing at the wall conceals the screw that secures it.
